

Wallet Password Recovery — Quick Playbook

ForgotWalletPassword.com · free · offline · printable

The order that decides the case

□ 1. Stop and protect

Copy the wallet file read-only. Never touch the original or your only backup. Work offline.

□ 2. Search for the file

wallet.dat, keystores, Electrum, vaults — backups, old devices, email, cloud. The 68-place search on the site is the full list.

□ 3. Check what you have

Do you have the seed? Restore. Do you have the file? Continue. Neither? The honest verdict page tells you your odds.

□ 4. Rebuild the password

Fragments, patterns, years, symbols — turn memory into a candidate list.

□ 5. Pick the right tool

btcrecover for wallet formats, hashcat for modes, John the Ripper for Monero/keystores. Official sources only.

□ 6. Run on a copy

Offline, on a copy, with a small test list first. Never upload anything.

□ 7. Verify before you move

Confirm the balance and addresses, then move funds to a wallet you control.

Never:

- share your wallet file, hash or seed with anyone
- upload anything to an online “unlocker” or recovery service
- run tools on the original file
